

Notes on “Tekla”-template

Gerald Q. Maguire Jr.

14 September 2026

This document is a work in progress.

This document describes and contrasts the third-cycle version of the thesis template I have developed for use at KTH Royal Institute of Technology (KTH) with that of the thesis template “KTH Doctoral Thesis Template” at <https://www.overleaf.com/latex/templates/kth-doctoral-thesis-template/gtbtnpgjnbsn> referred to from <https://www.kth.se/en/student/studier/examensarbete/avhandlingarochexamensarbeten/mall-for-avhandling-1.458236> [hereafter referred to as the Tekla-template]. My $\text{\LaTeX}$ template overcomes many of what I view as deficiencies of the Tekla-template*.

*Note that my referring to them as deficiencies is my own personal view of certain features (or lack thereof) of the Tekla-template and should **not** be taken as *personal criticism of those who were involved in the creation of the Tekla-template*, but rather should be viewed as constructive criticism that hopefully can be used to improve the Tekla-template or other similar efforts.

Contents

1	Good features of the Tekla-template	1
2	Deficiencies	2

1 Good features of the Tekla-template

The Tekla-template has a number of good features; these include (but are *not* limited to):

- ✓ The `my-phd-thesis.tex` file is very simple and easy to understand. It does have a front cover, title page, and book information page. While these will later be typeset by the printing service, they are very useful for the student, their supervisors, and others - especially to see that the degree, title, subtitle, and author's name are correct.
- ✓ The `\paper` macro is nice.
- ✓ The inclusion of patents in addition to papers is nice.
- ✓ The equation (4.1.2) nicely uses the modern notation: `\sympbfA`
`\sympfitx = \sympfitb`
- ✓ The requirement for the `mathtools` and `unicode-math` packages is good.
- ✓ The example figures, table, and code listing are good.
- ✓ The use of `\Cref` for the table, equations, figures, and the listing is good.
- ✓ The `acronyms.tex` file includes a nice collection of acronyms and a glossary entry.
- ✓ The `macros.tex` file includes some nice examples of macros, including:

Listing 1: Examples macros from `macros.tex`

```
\newcommand{\R}{\mathbb{R}}
\newcommand{\BigO}[1]{\(\mathcal{O}\left(\#1\right)\)}
\newcommand{\di}{\mathrm{i}\mkern1mu} % imaginary i in
↪ roman and with correct spacing
```

- ✓ The use of the `microtype` package is nice.
- ✓ the use of the `lstfiracode` package and its subsequent use in `style=FiraCodeStyle` when defining the listing format for Python is very nice.

2 Deficiencies

I believe that the Tekla-template has a number of deficiencies. These deficiencies include (but are *not* limited to) the following:

- ✗ The Tekla-template fails to consider the entire process related to the thesis. For example, the student (or someone else) needs to enter the metadata into DiVA and the English and Swedish titles will need to be entered into LADOK.
- ✗ The Tekla-template lacks a back cover. [Note that this too will be generated by the printing service - so this is a *minor* deficiency.]
- ✗ The Tekla-template does not seem to consider languages other than English and Swedish. Additionally, the support for Swedish is quite limited; for example, there is no information about a Swedish title or subtitle on the title page. Additionally, there is no configuration for the thesis being written in Swedish.
- ✗ The `\defence` macro collects the relevant information but the `\titlepage` macro does not have any support for a defense in Swedish.
- ✗ The Tekla-template has not parameterized the degree program or the degree - so the student may or may not correctly fill in this information.
- ✗ The title page lacks information about the supervisors.
- ✗ The book information page only seems to consider a traditional copyright and does not have any support for copyleft, such as Creative Commons licenses.
- ✗ The book information page does not seem to have any support to acknowledge the source of the optional cover illustration.
- ✗ The `dedication` environment sets the page `\raggedleft` in italics.
- ✗ While the AW-template also places the “List of included papers” before the table of contents - as does the Tekla-template, I think it should be placed just before the start of the kappa part (if there is a kappa). Additionally, the page should have the title “List of Publications”, since they are not necessarily all papers. Also, the capitalization is inconsistent with the capitalization of the other preface pages. Also, this page includes the paragraph:

\paragraph{Contributions} This doctoral dissertation consists of two parts. The first part provides an overview of the research field on which I focused and a summary of my contributions to it. The second part comprises the contributions that I have made to this research field through published works and patent applications.

However, this text is misleading in that it does not describe the author's contributions to the publication. Furthermore, this description should be in the body of the text and ideally follow a taxonomy such as Contribution Roles Taxonomy (CReDiT).

Moreover, in the case of a compilation thesis, the first `part` is the kappa and the second `part` is the included publications. The kappa is **not** simply an overview of the research field.

- ✗ The mechanism for the included papers does not effectively utilize the BibTeX file (or even include citations to the publications).
- ✗ While the Tekla-template's inclusion of patents in addition to papers is nice; however, there is no support for other sorts of publications, such as software, datasets, and artifacts.
- ✗ The position of the "Contents" heading is not consistent with the other preface pages.
- ✗ I do not see why the preface pages should be listed in the table of contents.
- ✗ The table of contents lists the kappa and Appended papers with the capital Roman numeral numbering - but the pages themselves are not numbered!
- ✗ I do not think that the included papers should be in a `part` with the name "Appended papers" - as they are "Included publications".
- ✗ While the included chapters provide some style examples, Chapters 2 and 3 are missing text before the first section in each chapter, which I think is a poor example for students. Additionally, the chapters fail to provide useful guidance to the author for the content that would be expected in the chapters.
- ✗ There is nothing in the template that explains what content would be in the chapter entitled "Points of perspective".

4 | Deficiencies

- ✗ The chapters and sections should probably all have labels to facilitate cross-references in the document.
- ✗ The table `tab:summary` might be a better example using `S[table-format=3.2]` rather than `r{}` for decimal aligning the prices.
- ✗ The `macros.tex` file is a mix of macros and `\usepackage`, it might be better to separate these into two files.
- ✗ In the definition of `macros.tex` file, the definition for `\BigO` when used with STIX Two Math would be `\mathscr{O}` rather than `\mathcal{O}` - as the letter that is wanted is capital O in chancery Script (*i.e.*, $\mathcal{O}$) and not a roundhand script (*i.e.*, $\mathcal{O}$). However, `unicode-math` already defines `\mscrO` which generates $\mathcal{O}$, *i.e.*, the mathematical script capital O symbol, which is Unicode character U+1D4AA.
- ✗ I would think that the tabbed page and the bibliographic information & copyright/permission information could all be on one page; rather than as separate pages as done in the Tekla-template. Also, the tabs printed by US-AB are shorter.
- ✗ The file `includedpapers.tex` states “% This file defines the included papers in a kappa.”. However, it really only defines the tabbed page and the bibliographic information & copyright/permission information page - it does not tell the student *how to include the publications into the thesis* nor does the template provide a folder for these included publications. Moreover, the papers are **not** included *in* the kappa, but rather are included together with the kappa in the (compilation) thesis.
- ✗ While **Fira Code** is nice for program listings, it is unclear to me why the mono-spaced font should be **Fira Code**. There are places other than program listings where a mono-spaced font would be suitable, and this font should probably be chosen to suit the font used for the body text [hence my use of TeXGyreCursor with TeXGyreTermes and TeXGyreHeros]. It is surprising that since **Fira Code** is known for its programming ligatures, the example chosen does not show this feature.
- ✗ **Fira Code** has 1585 glyphs, and one of these is a visible space, *i.e.*, Open Box “ $\sqcup$ ” (U+2423). The `lstinputlisting` of the Python example program uses **CMTT10** for this character. This can be fixed by adding the code in Listing 2 to `macros.tex`.

Listing 2: Set the character used for a visible space in listings

```
\makeatletter
\def\lst@visiblespace{\texttt{^^^^2423}}
\makeatother
```

- ✗ In the definition of `\lstset` for Python, you might set `tabsize=4`, as this is the number of spaces your `example.py` used for the indent.
- ✗ While the use of the `microtype` package is nice, one might add the `babel=true` option to the second `\microtypesetup`. Note also that the `babel` package must be loaded before the `microtype` package when using the `babel` option.
- ✗ When you specify the `cleveref` form for an equation in Listing 3, you might add a comment that you are going to use a parenthesized equation number to refer to the equation from your text; therefore, there are no singular or plural cross-reference names. Additionally, you might promote the use of descriptive label names, for example `eq:integralAsLimitOfSum` instead of `eq:three`.

Listing 3: Configuring `cleveref` for equations

```
\crefname{equation}{}{}
\Crefname{equation}{}{}%
```

- ✗ In your examples of equations, you might note that there is a subtle issue about when equations should be numbered and when not, *i.e.*, if they are not referred to from elsewhere, then they should not be numbered. This can be done automatically with the `mathtools` package with `\mathtoolsset{showonlyrefs}`. Note that this will **only** work if you use `\eqref` to reference your equations*. The `cleveref` manual states: “`Cleveref` is currently incompatible with the `mathtools` package’s `showonlyrefs` option, which automatically labels only those equations that are cross-referenced. The `autonum` package provides a possible alternative, which implements similar features in a `cleveref`-compatible manner.”.
- ✗ While the glossary entry for “PhD” is humorous, it is a bit misleading and perhaps not helpful to your readers. There are only a very small fraction

*There is also a bug when using the `ntheorem` package if the option `thmmarks` is active. See the `mathtools` manual for details and solutions.

($113/7292 = 1.5\%$) of theses that are 300 or more pages (including preface pages); in fact, the CDF of total pages at 300 pages are approximately: ABE: 0.9793, CBH: 0.9972, EECS: 0.9939, ITM: 0.9905, and SCI: 0.9916. Looking at the CDF of total pages, the first bin (using a bin size of 10) of lengths exceeding 0.90 occurs at: ABE: 120, CBH: 90, EECS: 110, ITM: 110, and SCI: 100 pages.

- ✗ The Tekla-template does not include the keywords in the document's properties.
- ✗ The Tekla-template does not include the copyright information in the additional metadata.
- ✗ In setting fontsize, for example, when setting the fontsize for a section in Listing 4, it might be better to use `\fontsize{14}{16}\fontseries{sb}` to set `\baselineskip` to be larger than the font size of the text and to select the semibold version of the glyphs. The AW-template specified that the font size for a section was 14pt.

Listing 4: Setting font for section headings

```
\titleformat{\section}
  {\sffamily\fontsize{13pt}{13pt}\selectfont\bfseries} % Figtree
  ↳ Semibold, 13pt
  {\thesection}{1em}{}

```

- ✗ **LMSans17-Regular** is one of the embedded fonts, and it uses a custom coding (note that it appears twice). This font is used in `example-image-a` and `example-image-b` images provided by the `mwe` package. **CMTT10** is another embedded font. **CMTT10** is used for the visible space in the code listing. [See Listing 2 for how to avoid the use of **CMTT10**.]
- ✗ While the requirement for the `mathtools` and `unicode-math` packages were good, it is unclear to me why the mathfont used is `latinmodern-math.otf` rather than a more complete font such as **STIX Two Math**: `latinmodern-math` has 2045 glyphs versus **STIX Two Math** with 4605 glyphs. For the list of characters present in one, but not the other see Tables 1 and 2. Note that some of the glyphs in **STIX Two Math** make use of the Private Use Area, U+E000 - U+F8FF; specifically, U+E000 to U+E3FF. These unicode values **cannot** be interpreted without the knowledge that the

font being used was STIX Two Math. This means that these characters **cannot** be used in DiVA and LADOK.

Table 1: Characters in latinmodern-math but not in STIX Two math
